Multicentric Document Filing System Serial Key is a freeware application developed for users who want to manage shared documents over the Internet. This tool features the ability to insert and merge metadata into the documents and to export (email, ftp, or sftp) all shared documents. Multicentric Document Filing System allows you to handle not only documents but also folders that contain documents. The process of sharing documents with your colleagues is quite simple. You can establish a server (in real time or in batch) and then add groups of users. After that, each user is able to insert metadata into documents that they receive and receive documents for which they have inserted metadata. The main features of Multicentric Document Filing System are: • A customizable interface that will allow you to fully adapt the application to your own needs. • The ability to insert metadata into the files and to establish an auto-generated search for all documents. • The import and export functions for documents (email, ftp, sftp). • The option of sharing your documents over the web through FTP and email. • The ability to print documents in a standard or an extended version, using a thumbnail (extracted from the original file). • The ability to share folders (Folders > Folder Sharing). • The ability to create multiple groups of users. You can enter the ID of the group in the "Group selection" tab and have users select the group in a similar manner. • A complete help file of the application. Requirements: • Internet Explorer • WinXP, Vista, or Win 7; • MS Outlook 2003 or 2008 or compatible email client. • Multicentric Document Filing System features, when "Turn on support for". 1. Field of the Invention This invention relates to a semiconductor device for high frequency use, and more particularly to a semiconductor device using a Field Effect Transistor (FET) which is manufactured by using a bipolar transistor.

2. Description of the Related Art In a semiconductor device for high frequency use, a bipolar transistor is frequently used for the purpose of impedance conversion and, in particular, for the purpose of high frequency amplification. However, it is very difficult to reduce the size of the bipolar transistor, and the realization of a bipolar transistor on an integrated circuit is difficult. On the other hand, in recent years, the MOS transistor has come to be actively used as an amplifier for high frequency amplification. The reason for this is that the realization of a MOS transistor is easy and the size of the MOS transistor is easily reduced. However, a MOS transistor has a problem in that the frequency dependence of gain and phase varies as the drain current or source current changes. Furthermore, the MOS transistor has a problem in that the high frequency characteristic is degraded as the area ratio of the drain current with respect to the area of the source region and the drain region increases. In order to avoid these problems, the size of the parasitic resistance of the drain region is made smaller as much as possible. However, if this is attempted, the gain will drop significantly. Furthermore, since the transistors used in power amplifiers are made larger, the inductance that appears in the drain region as the transistor is turned off cannot be ignored and the gain also drops due to the reactance of the inductance. Therefore, a method for connecting a bipolar transistor and a MOS transistor in parallel has been proposed. However, in this method, there are problems in that the gain is degraded and its frequency characteristic becomes poor. In order to avoid these problems, a method for improving the frequency characteristic by connecting three FETs in parallel has been proposed. For example, according to "High Performance Bipolar-FET
